AVERAGE

# Why should a tester monitor production?

- Learn about system behavior
- Learn about the usage of the system
- See all (potential) errors in the systems
- Prevent bugs getting to users before we fix them
- Get ideas for functional tests
- Oracles for our performance tests
- Simulate usage and see what happens
- Use it on all environments (not just prod)

# Be careful

- One tool is never enough
- Be suspicious about results
- Consult with others
- Monitor tools also
- Don't just set tools, use them also
- Educate others how to use them
- Add alerts and tune them

Thank  
You!
